What is the Earth System?

What is the Earth System?

Met Office

One thing changes everything

Human activities like burning coal, oil and gas to power our homes, factories and transport have released huge quantities of carbon dioxide into the atmosphere, causing an enhanced greenhouse effect. This causes an imbalance in the energy cycle that, in turn, impacts the water cycle, atmospheric circulation and ocean currents, leading to changes in weather and climate.

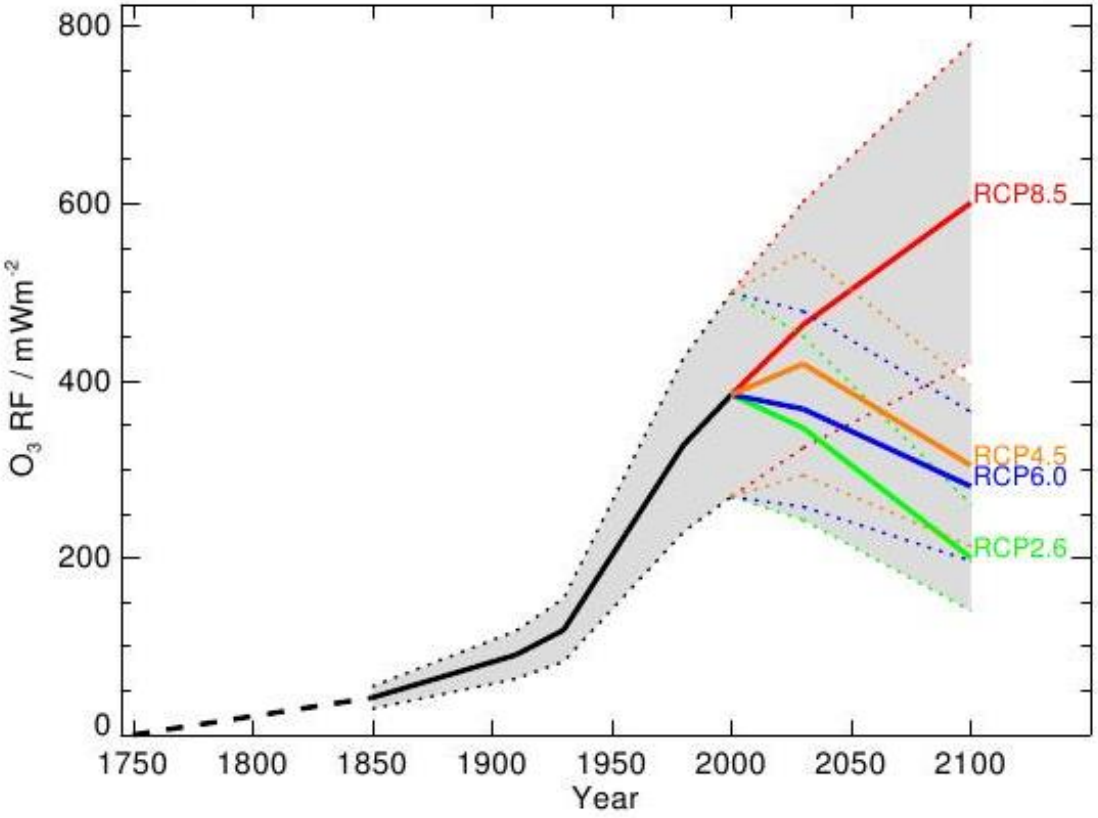
Hadley Centre

Why do we study Earth System Science?

Why? – Climate Forcing (1)

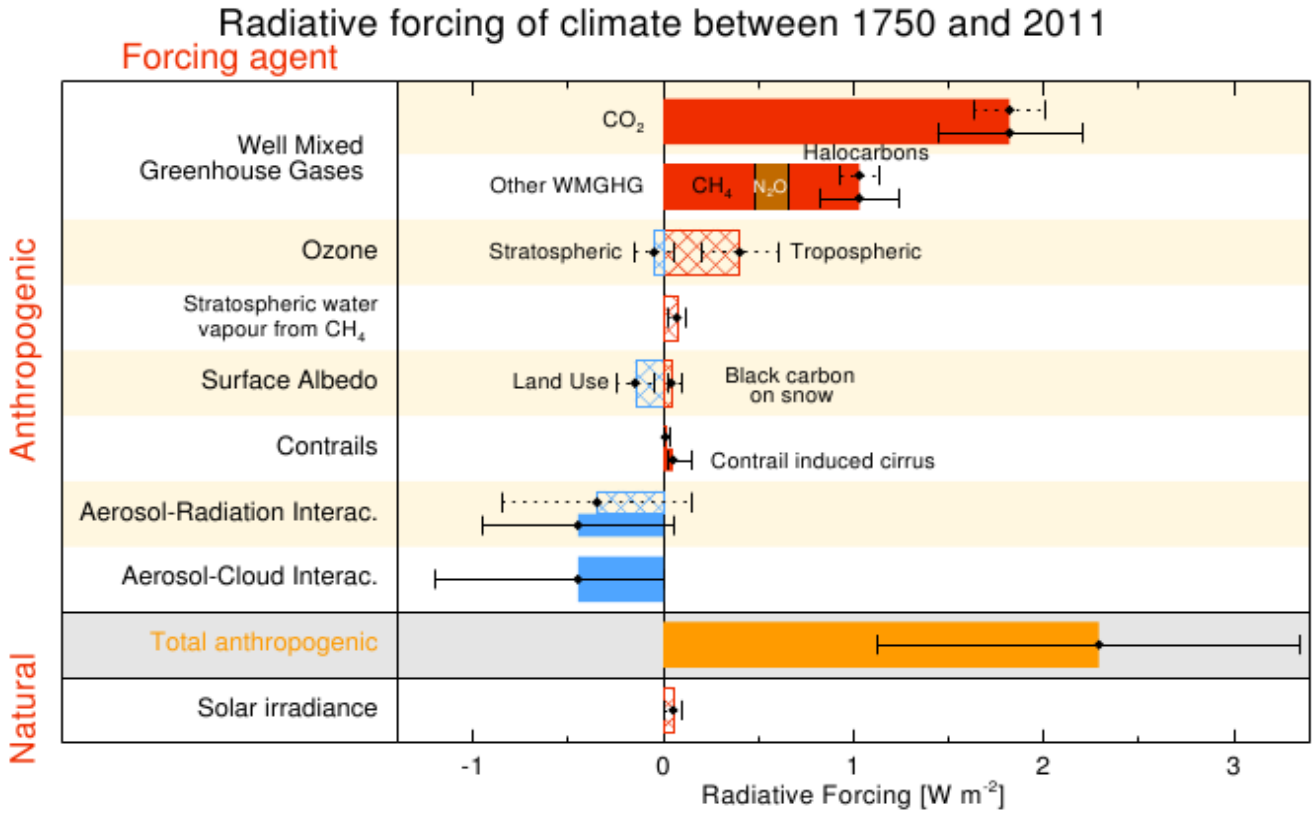
Tropospheric O_3 forcing



Multi-model study called Atmospheric Composition and Climate Model Intercomparison Project (ACCMIP) and included HadGEM2-ES

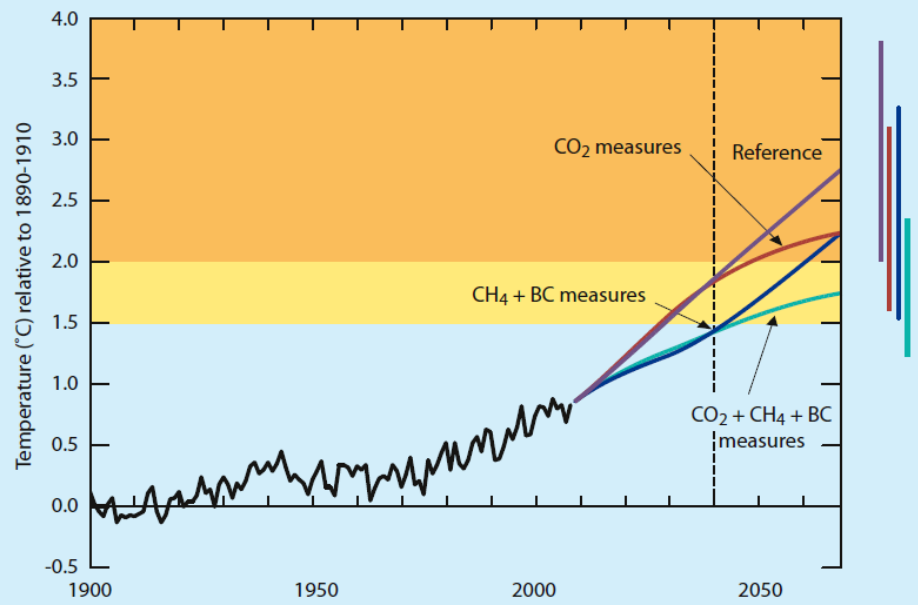
Stevenson et al., Atmos. Chem. Phys. (2013)

Why? – Climate Forcing (2)



Why? – Mitigation

Climate Change Mitigation refers to actions, which aim to reduce magnitude and/or rate of climate change



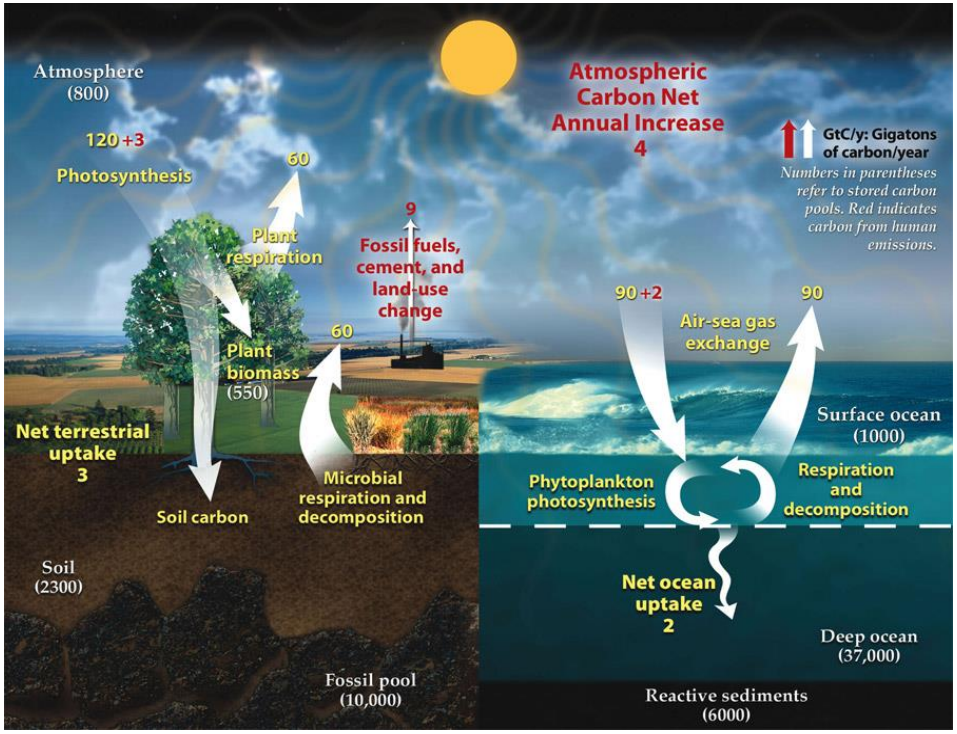
UNEP, 2011

CH_4 Emission Reductions:

- Technologically feasible although investment required
- Offer a near-term climate benefit
- Reduce tropospheric O_3 and improve air quality

Why? – Carbon Cycle Feedbacks (1)

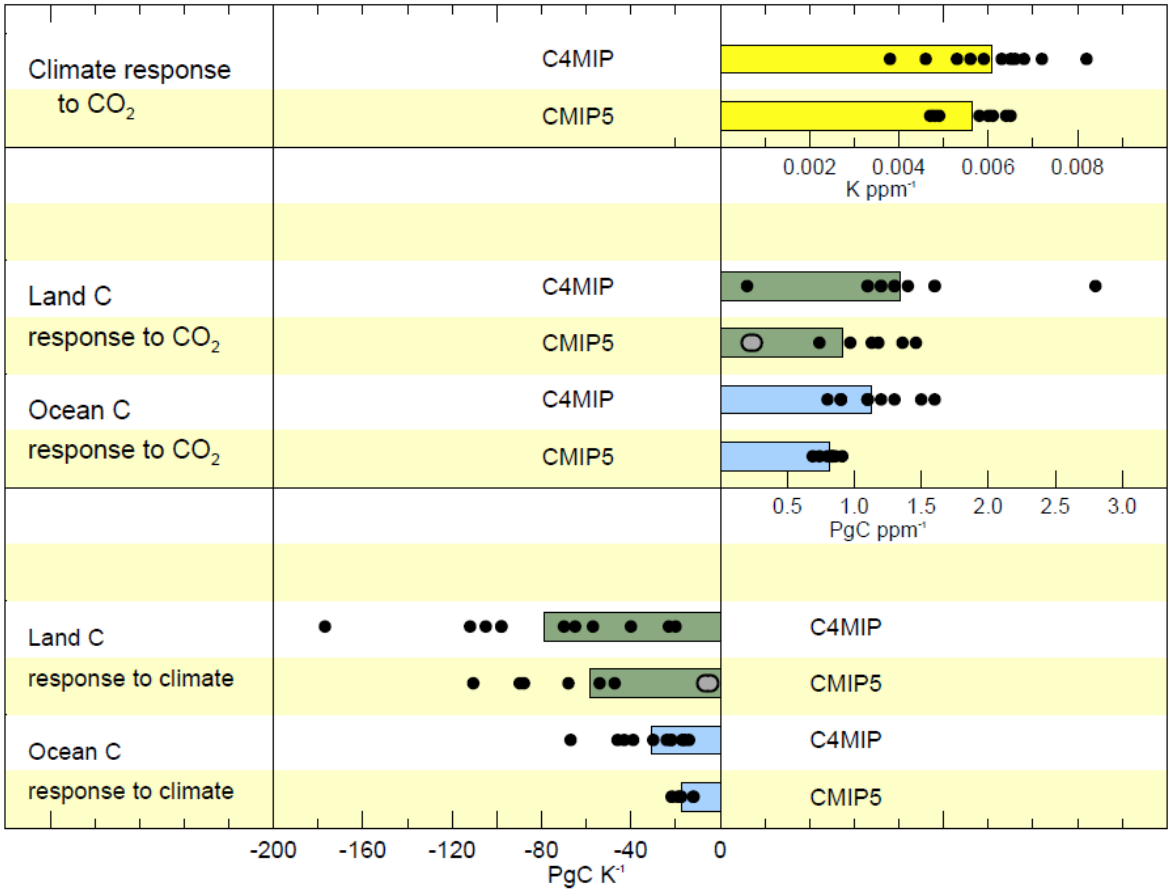
The carbon cycle is intimately linked to the physical climate system and requires an accurate simulation of associated biogeochemical cycles (e.g. H_2O, N_2, O_2)



Earth's carbon sources/sinks may be sensitive to climate change or increased CO_2 loading, changing the rate of uptake of (emitted) CO_2 from the atmosphere by the global biosphere

Why? – Carbon Cycle Feedbacks (2)

Response of C uptake to changing atmospheric CO_2 and climate — Large uncertainties, esp. in terrestrial carbon cycle



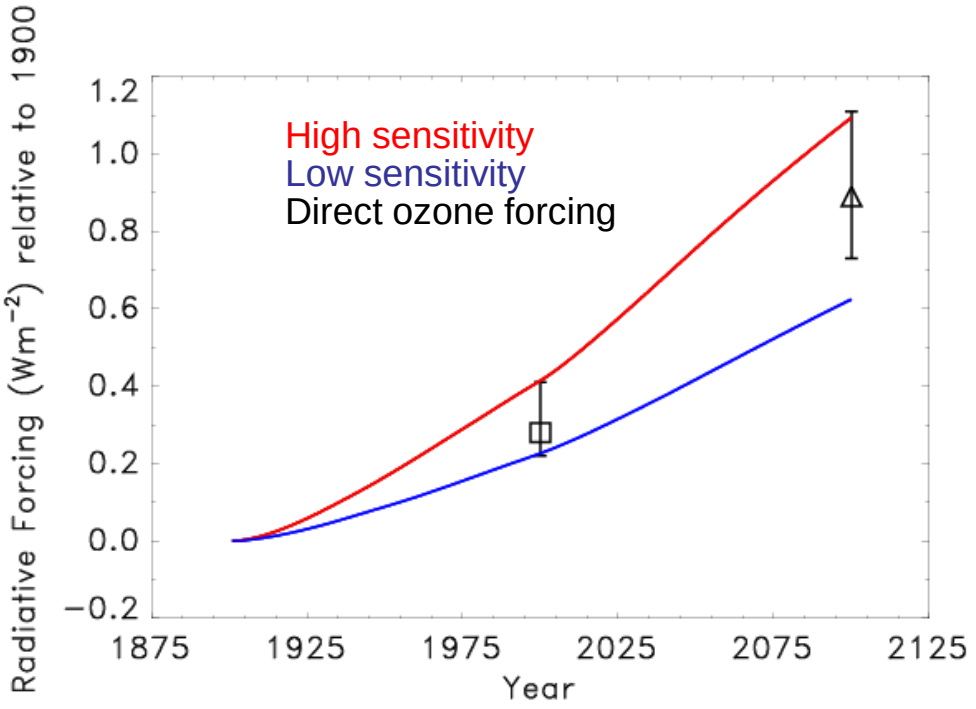
Models with a terrestrial Nitrogen cycle

Why? – Chemistry Climate Interactions (1)

- Ozone damage reduces the amount of carbon removed from the atmosphere by plants

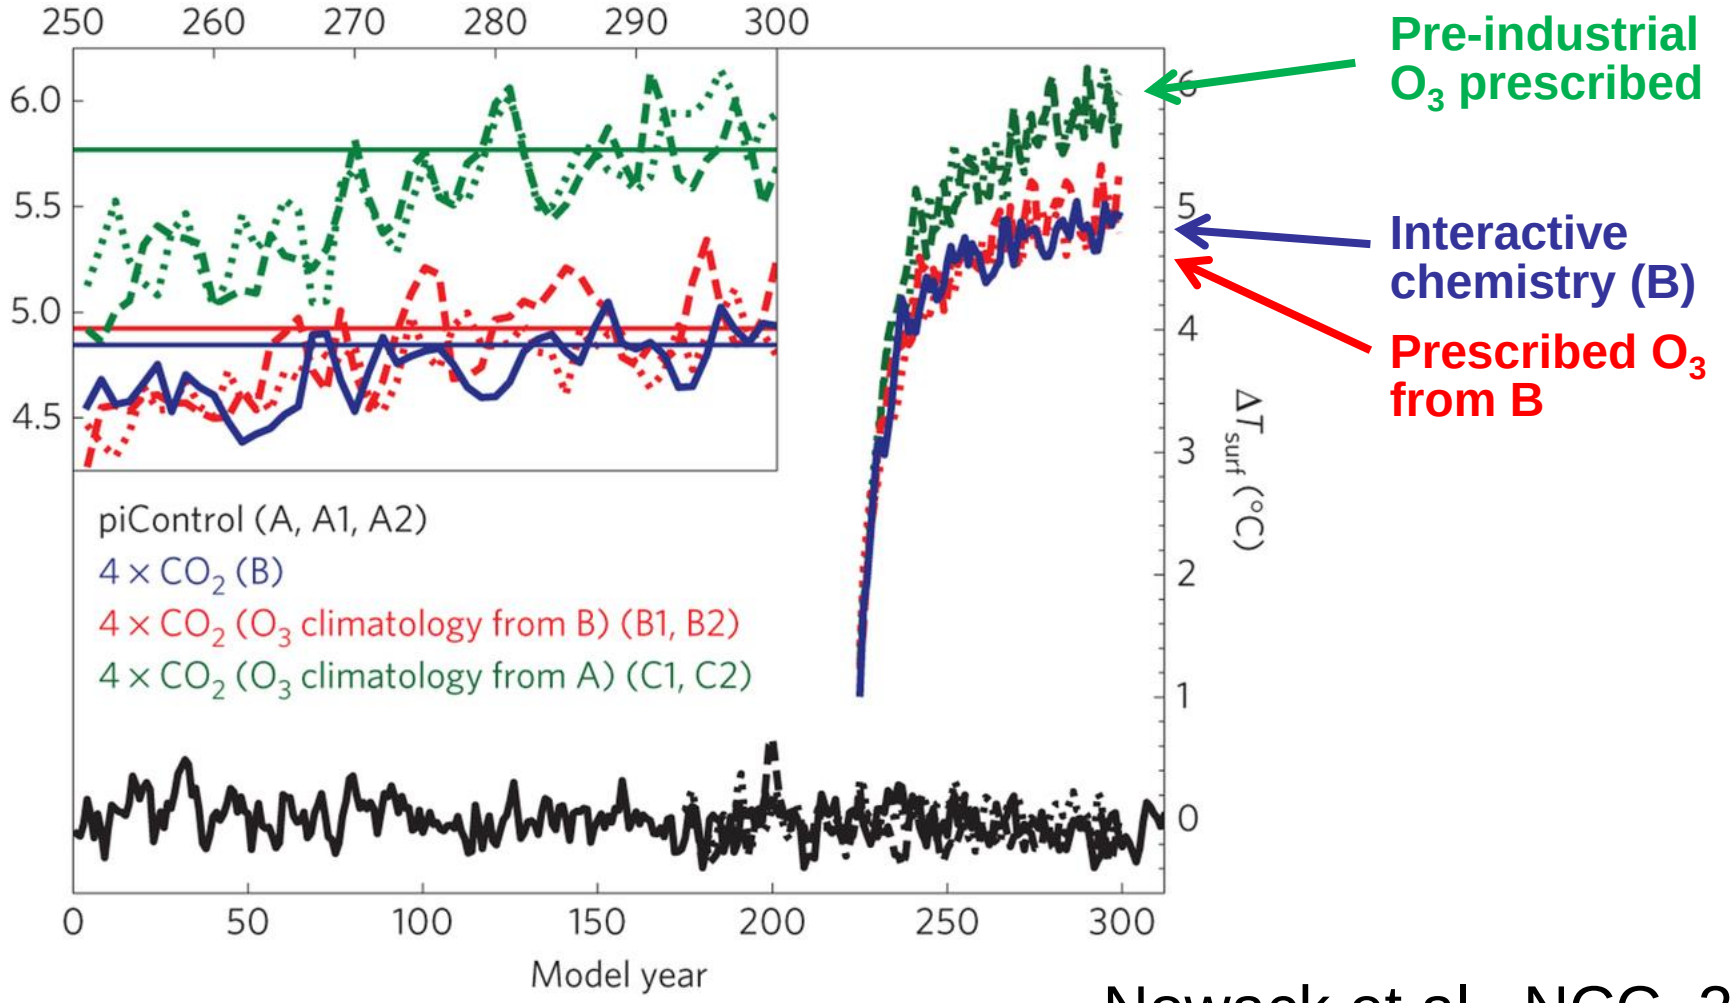
- Quantified RF over 20th & 21st Centuries

- Indirect forcing from the extra CO_2 is comparable to the direct radiative forcing from ozone



Sitch et al., Nature, 2007

Why? – Chemistry Climate Interactions (2)



Nowack et al., NCC, 2014

★ HadGEM2-ES

Stevenson et al., ACP (2013)

Megacities: HadGEM2-ES with ExtTC (1)

Species	2005		2050	
	Base	Megacities	Base	Megacities
Long-lived greenhouse gases[a]				
CO_2 (Tg yr^{-1})	32,250.0	3870.0 (12%)[b]	68,280.0 (+112%)[c]	8194.0 (+112%)
CH_4 (Tg yr^{-1})	321.4	22.5 (7%)	676.8 (+110%)	47.4 (+111%)
N_2O (Tg yr^{-1})	8.0	0.3 (4%)	20.1 (+150%)	0.8 (+151%)
Short-lived climate forcers[d]				
NO_x (TgN yr^{-1})	43.4	2.0 (5%)	37.1 (−15%)	0.8 (−60%)
CO (Tg yr^{-1})	1080.4	35.8 (3%)	948.4 (−12%)	23.0 (−36%)
SO_2 (TgS yr^{-1})	28.5	1.5 (5%)	13.2 (−54%)	0.5 (−66%)
BC (Tg yr^{-1})	6.6	0.3 (5%)	4.5 (−32%)	0.1 (−66%)
OC (Tg yr^{-1})	34.2	1.0 (3%)	28.0 (−18%)	0.7 (−30%)

[a] Based on EDGAR4.0 emission inventory.
[b] Percent contribution of megacities.
[c] Change in emissions relative to present-day level (reference year 2005).
[d] Based on CMIP5 RCP8.5 emission scenarios European Commission (2009).

relative change at present-day: contribution of megacities.

relative change in future: change from present-day.

Folberth et al., Urban Climate (2012)

Megacities: HadGEM2-ES with ExtTC (2)

Species	2005 DRF (mW m^{-2})	2050 DRF (mW m^{-2})
DRF from megacity emission of long-live greenhouse gases		
CO_2 (tot AMTOA)	+120.0	+254.0
CH_4 (tot AMTOA)	+28.4	+59.8
N_2O (tot AMTOA)	+3.3	+8.8
Total forcing long-lived (AMTOA)	+151.7	+322.6
DRF from megacity emissions of short-lived climate forcers		
CH_4 (tot AMTOA)	−1.9 ± 0.04	−0.7 ± 0.02
O_3 (tot AMTOA)	+5.7 ± 0.02	+2.8 ± 0.02
SW_{as} (tot AMTOA)	−6.1 ± 0.21	−2.2 ± 0.10
LW_{cs} (tot AMTOA)	+1.5 ± 0.01	+0.6 ± 0.01
Total forcing short-lived (AMTOA)	−0.8 ± 0.24	+0.5 ± 0.09
Combined direct radiative forcing		
Total forcing (AMTOA)	150.9 ± 0.24	323.1 ± 0.09

With $\lambda \sim 1.0$ K/(Wm^{-2}) it follows:

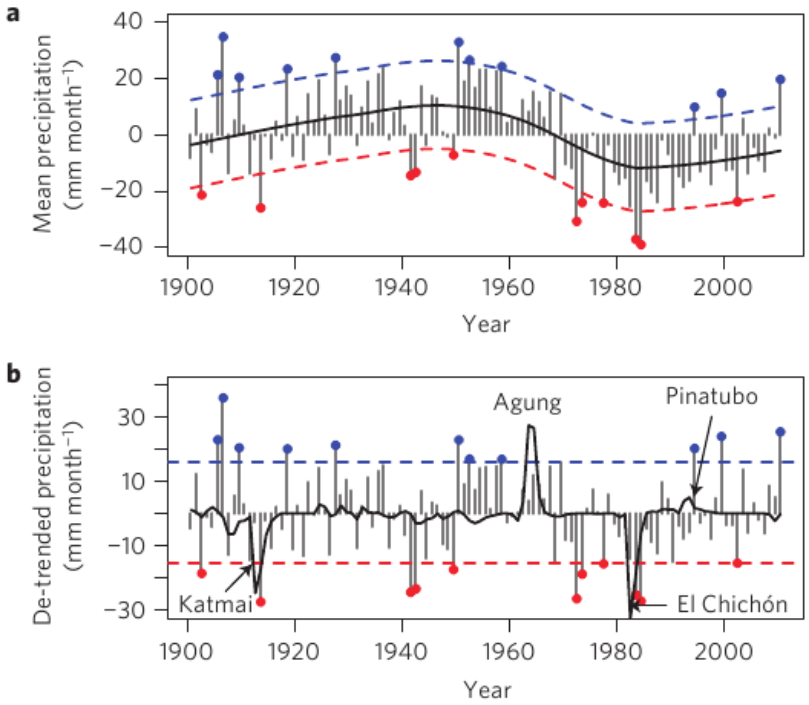
- in 2005: $\Delta T_{sfc}^{equil} \approx 151$ mK
- in 2050: $\Delta T_{sfc}^{equil} \approx 323$ mK

$\Rightarrow \Delta T_{sfc}^{equil,(2005\text{-}2050)} \approx 172$ mK

+800 mK global surface warming since the pre-industrial.

Folberth et al., Urban Climate (2012)

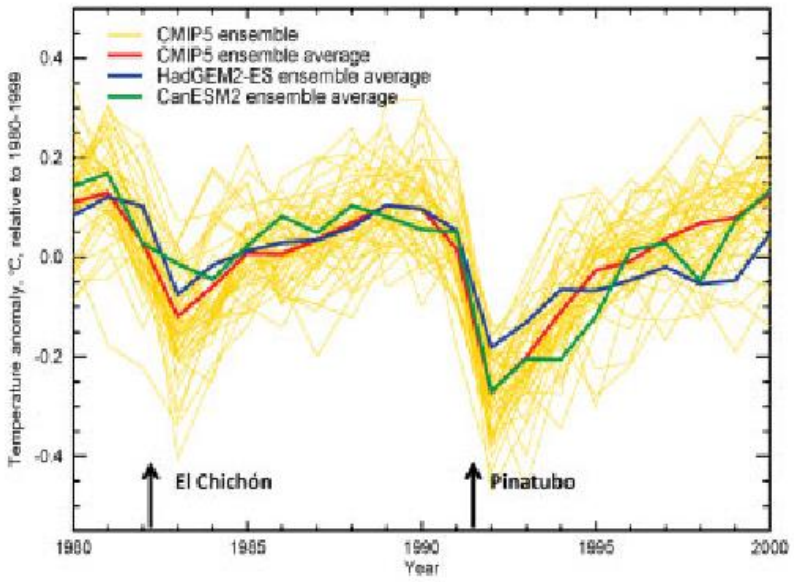
Volcanic Eruptions: Sahel Rainfall

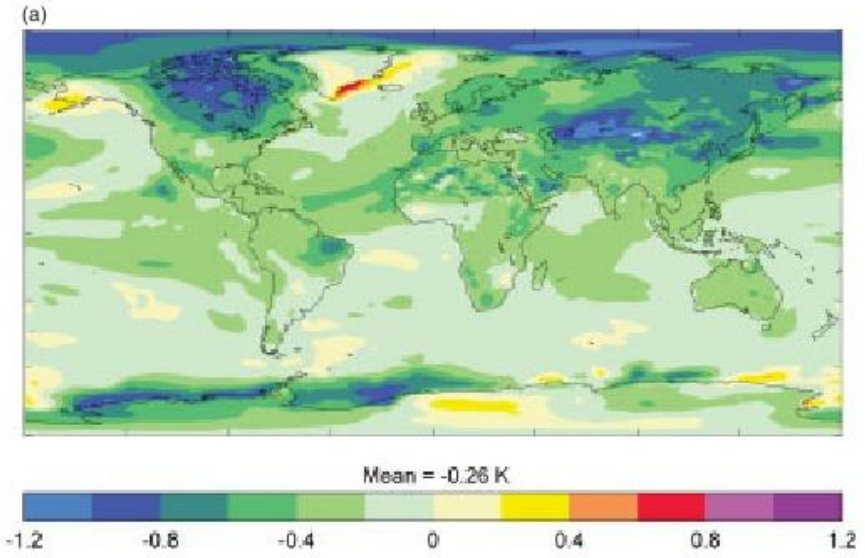


Three of the four driest Sahelian summers were preceded by substantial Northern Hemisphere volcanic eruptions

Haywood et al. (2013)

Volcanic Eruptions: Role in Global Warming Hiatus?





Modest volcanic eruptions since 2000 give rise to a global mean cooling of around −0.02 to −0.03 K over the period 2008–2012. They do not appear to be the primary cause of the recent global warming hiatus.

Haywood et al. (2014)
