**Quantifying and
Understanding
the Earth System**

**National Centre for
Atmospheric Science**
NATIONAL ENVIRONMENT RESEARCH COUNCIL

Introduction

- Changes in **GHG growth** rates eg CH_4 in early '90s
- **Causes?**: Pinatubo, ENSO
- **Sources** (wetlands, burning) & **Sinks** (OH)
- **Isoprene** (C_5H_8), a biogenic VOC, is a competing reaction for OH
- Probe effect of **climate** dependent isoprene emissions

Method

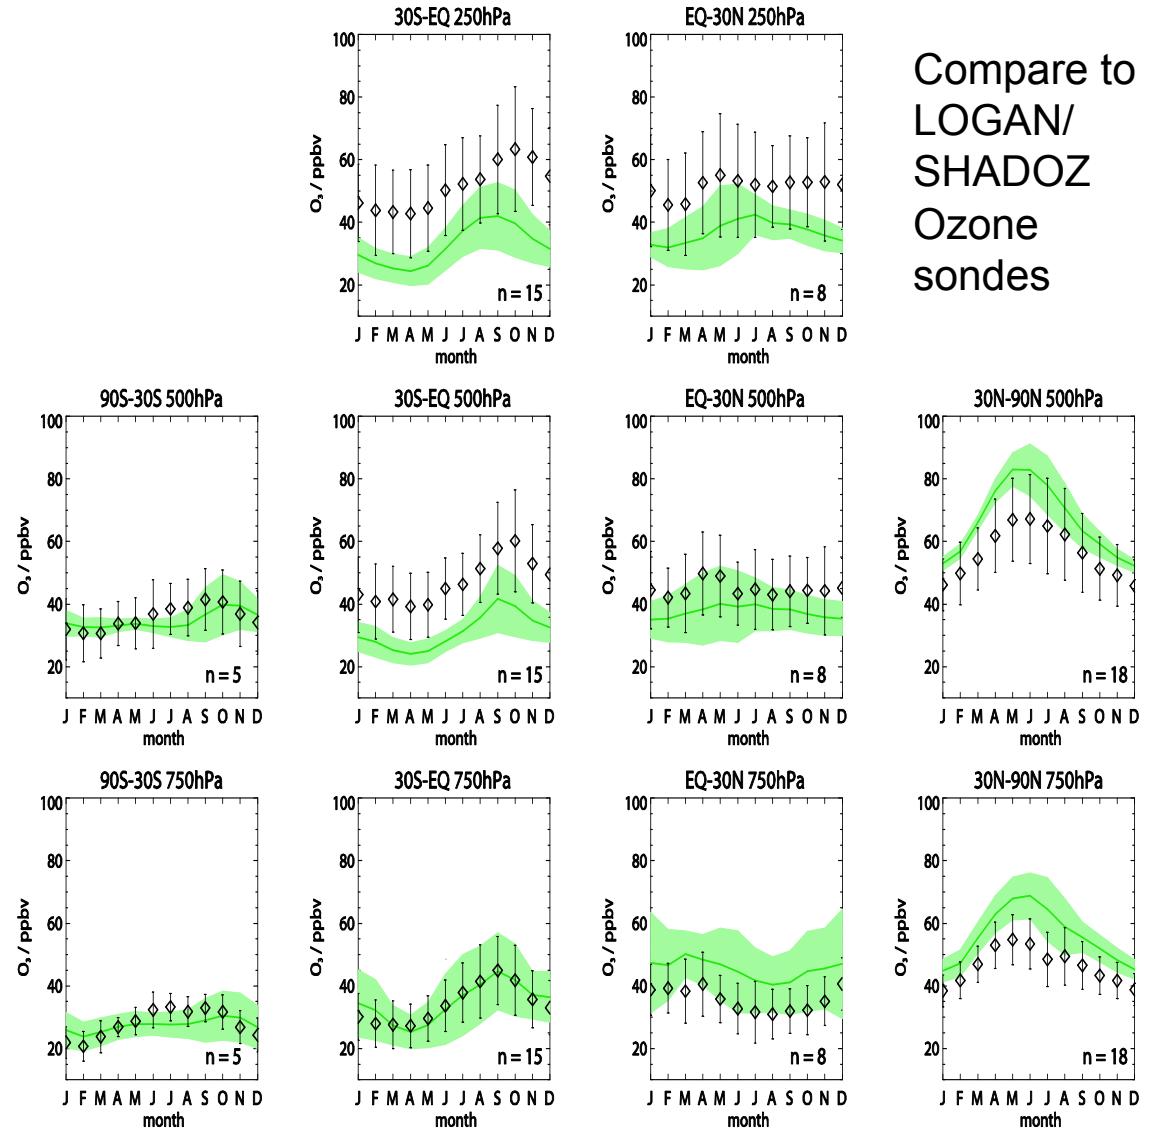

- Isoprene emissions sensitive to **temperature, precipitation, humidity, insolation**
- Run '**Nudged**' GCM (UM) to obtain these quantities
- Run **Sheffield BVOC** model for isoprene emissions
- Feed emissions back into Nudged CCM **UKCA**
- Prototype of Earth System Model (**QUEST**)

- Perform **3 runs** to probe C_5H_8/OH
- Study **global & regional** changes

	Meteorology	Emissions
Base	1990-97	1990-97
Emfix	1990-97	1990
MetFix	1990	1990-97

Model Description

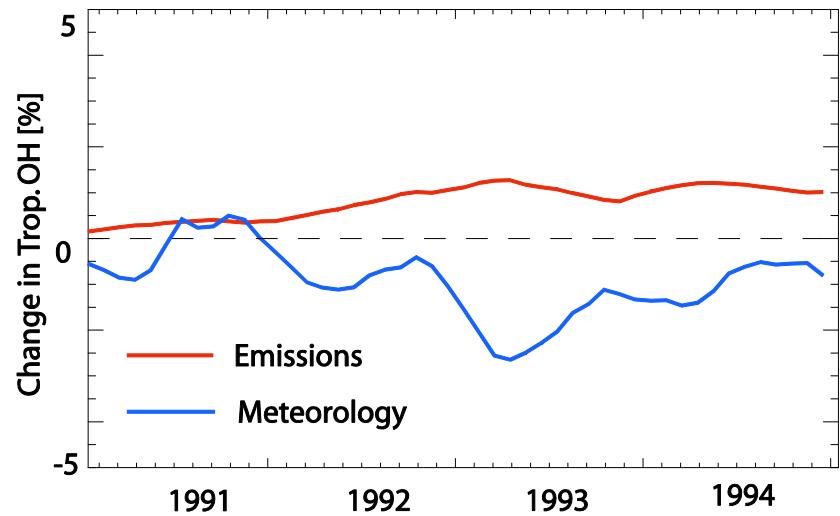

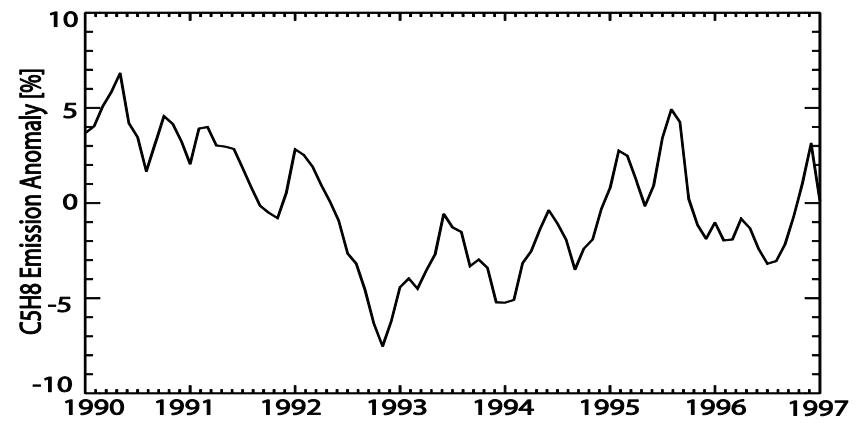

- Use UKCA CCM with Tropospheric Chem.
- Compare to ozone data
- Mainz isoprene mechanism (MIM)
- Fix Methane to 1.76 ppmv
- Nudge to ERA-40 to obtain dynamical changes
- Parameterise changes in SW Flux

Thanks to L. Abraham

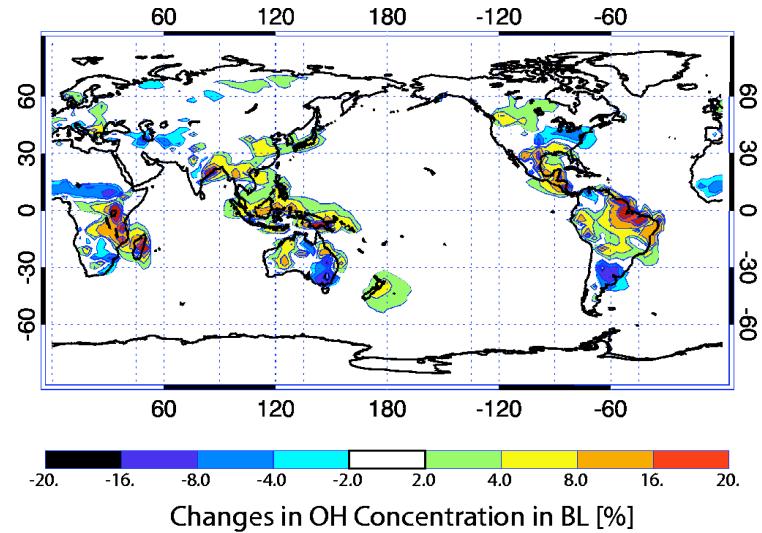

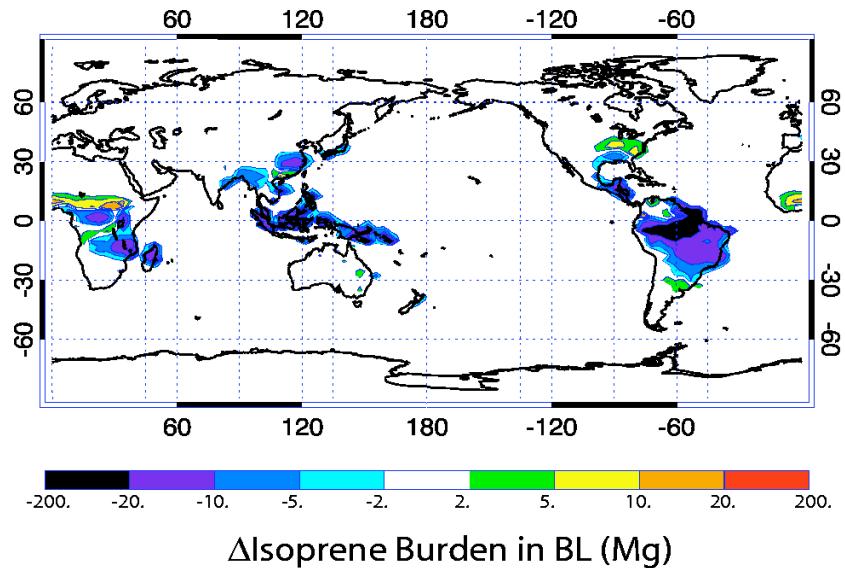

Global Variations

- Plot Isoprene emission anomalies
- See changes of ~10%
- Plot effect on OH
- Emissions = (Emfix – Base)
- Meteorology = (Metfix – Base)
- Emissions comparable to meteorology

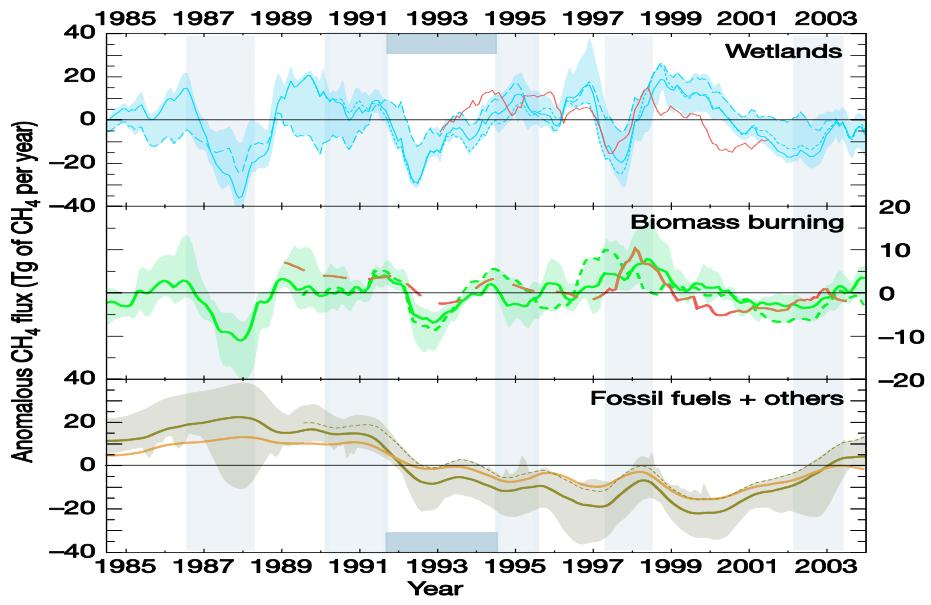

Regional Impacts

- Examine **distribution** of changes
- Plot Effect of '**Emissions**' in 1993
- Isoprene changes near **emissions**
- OH changes & C₅H₈ anticorrelated
- **Large** effect on OH (up to 20%)

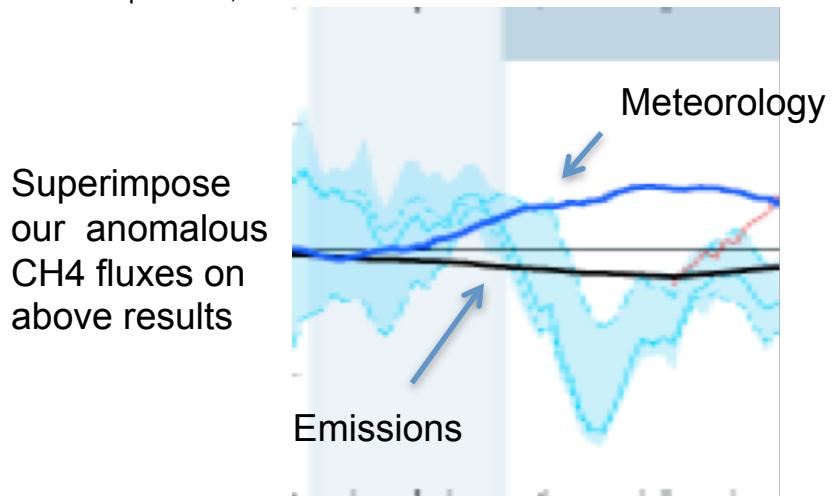

Methane Budget

- Bousquet et al have studied variability of methane **sources**
- Examine impact of OH changes on methane
- **Superimpose** on wetland for 1990-94
- **Comparable** to this main source of variability

Bousquet et al, 2006

Conclusions

- Climate changes after Pinatubo induce significant changes in isoprene emissions
- These impact on regional OH and global methane concentrations
- Demonstrates the importance of Earth System Modelling
- Also interesting effects in stratospheric ozone (see poster)

Back up Slides

UKCA CCM (Trop Version)

- Community chemistry model embedded in UM
- 60 levels
- O₃, HNO₃ prescribed above 10 hPa
- 2.5 by 3.75 resolution Forced with sea surface temperatures and sea ice
- Current configuration:
- 56 tracers
- 120 bimolecular, 16 termolecular reactions
- 37 photolysed, 31 dry deposited, and 23 wet deposited species
- Species emitted: NO, CO, HCHO, ME₂CO, MECHO, C₂H₆, C₃H₈, C₅H₈
- HO_x NO_x chemistry of ethane, propane & isoprene

Nudging

- Nudging reads in analyses to give model ‘real climate’
- Use ERA-40
- Removes Biases
- Reproduces variability
- ACP Tech Note with details (*Telford et al 2007*)
